ShelfSentry AI - Active-Perception Shelf Inspection on AWS

Inspection

Upload a shelf image or video, or run the bundled sample, to start an active-perception inspection.

Shelf media

Image or video file

Choose File No file chosen

Accepted types: image/jpeg, image/png, image/webp, image/bmp, video/mp4, video/quicktime, video/x-msvideo. Maximum size 25 MB.

Start inspection | Run example (bundled sample)

âœ“ Inspection complete

Report id: `insp-20261025-cf9160807a7d`
Status: complete
Human review: Not required

Finalized after 4 decision(s) and 3 tool execution(s) (terminal action: finalize_report). Candidate regions are estimates with visual caveats; any empty-looking region is reported with its caveats and is not asserted as a proven out-of-stock condition.

Inspection results

Recommendation

Finalized after 4 decision(s) and 3 tool execution(s) (terminal action: finalize_report). Candidate regions are estimates with visual caveats; any empty-looking region is reported with its caveats and is not asserted as a proven out-of-stock condition.

✓ Complete No human review required.

Visual evidence

Highlighted regions are classical computer-vision estimates, not certainties.

Original input

The original uploaded image is referenced by the report; the annotated output on the right marks each detected region.

Annotated output

Candidate regions

No candidate regions are inlined with this report.

Agent decision trace

Initial finding: `insp-20261025-cf9160807a7d-image`

Iteration 0 · agent decision

Action: `inspect_crop`

Rationale: Region with moderate uncertainty and heuristic score suggests further inspection is needed to clarify the condition.

Decided by bedrock

Iteration 0 · tool execution

Tool: `inspect_region_crop`

Result: ✓ ok (ref media://9e347ab800b11fdef65cd8cb262c14b1)

Iteration 1 · agent decision

Action: `inspect_crop`

Rationale: Region 0002 has a similar uncertainty value and heuristic score as region 0001, and both regions are estimates of empty space. Further inspection is needed to confirm the findings.

Decided by bedrock

Iteration 1 · tool execution

Tool: `inspect_region_crop`

Result: ✓ ok (ref media://42f39072f73735854944175c943f3e14)

Iteration 2 · agent decision

Action: `inspect_crop`

Rationale: The uncertainty value is high, and the region is very small, so we need to inspect it more closely to gather more evidence.

Decided by bedrock

Iteration 2 · tool execution

Tool: `inspect_region_crop`

Result: ✓ ok (ref media://93514245a00451fbb053c20d15c1993b)

Iteration 3 · agent decision

Action: `finalize_report`

Rationale: Multiple inspections of the same region have been conducted, and the uncertainty value is high, suggesting we should not assert an out-of-stock condition as proven. It is time to finalize the report.

Decided by bedrock

Evaluation

Measured test-set performance from recorded evaluation runs. Every value shown is a measured result; no metrics are estimated or fabricated.

Run `eval-66bca98376a7`

○ DEMO DATA

8 labeled samples evaluated.

Measured performance summary

Metric	Measured value
Agent decision correctness	`100.0%`
False positives	`0`
False negatives	`2`
Processing latency (p50)	`68 ms`
Processing latency (p95)	`97 ms`

False-positive examples

No false-positive examples were recorded for this run.

False-negative examples

Sample	Expected	Actual	Note
`eval-gap-single-right`	has_gap=True (drew 1 gap(s))	has_gap=False	Stocked shelf with one empty gap on the middle-right row; a borderline case for the empty-ratio threshold, so its terminal action is excluded from the decision-correctness metric. The vision heuristic flagged no empty region although a gap was drawn (false negative).
`eval-gap-bottom`	has_gap=True (drew 1 gap(s))	has_gap=False	Stocked shelf with one wide empty gap on the bottom row; a borderline case for the empty-ratio threshold, so its terminal action is excluded from the decision-correctness metric. The vision heuristic flagged no empty region although a gap was drawn (false negative).

Documented failure cases and limitations

- The evaluation images are SYNTHETIC: they are drawn programmatically with NumPy and OpenCV, not photographed from real shelves. Their labels are the project authors' own ground truth for drawn content and are NOT real retail ground truth; measured performance here does not predict real-world accuracy.
- The detection metric scores a coarse per-image 'has_gap' boolean (does the vision pipeline flag any empty region at or above the configured empty-space-ratio threshold) against whether a gap was deliberately drawn. It is a heuristic sanity check, not a bounding-box-level accuracy measure, and it inherits the classical-CV heuristic's limitations.
- Agent decision correctness compares the active-perception loop's TERMINAL action against a hand-labeled expected terminal action, only for the subset of samples where a single expected terminal action is well defined. It measures whether the deterministic fallback policy routes each scene to the intended action; it does NOT measure the correctness of a learned/LLM policy and does not apply to samples left unlabeled.
- The set is deliberately small and reproducible (a handful of scenes) to stay fast and asset-free; it is not a statistically powered benchmark.
- Latency percentiles are wall-clock measurements taken on the machine that ran the evaluation (time.perf_counter around the real pipeline) and are therefore environment-dependent; absolute values will vary by hardware, load, and OpenCV build.
- Agent decision correctness was measured over 6 of 8 samples that carry an expected terminal-action label.
